Yang-Baxter deformations of the flat space string

Thursday, 6 July 2023 12:30 (30 minutes)

The study of symmetric space sigma models and their integrable Yang-Baxter deformations in the context of the AdS/CFT correspondence has led to many important results. However, the quantization of these models remains a challenging problem. To gain new insights into the quantum structure of these models, we propose to study Yang-Baxter deformations of the flat space string. The advantage of flat space is that it allows us to perform certain calculations explicitly, which can serve as a check to some of the known theory.

In this talk, we will present our approach to extending Yang-Baxter deformations to flat space and we will demonstrate an explicit check of some known results.
